

OSINT STRATEGIC REPORT: Hempoxies™ 13A Classic (Structural)

Title: 11-Component Industrial SOP & Supply Chain Blueprint (Master Formulation) **Author:** Marie-Soleil Seshat Landry, Queen of the Universe, ORCID iD: 0009-0008-5027-3337
Organization: Landry Industries / Landricus / Global Organic Solutions **Keywords:** #Hempoxies #EHSO #Biochar #HDCF #Mitlinitite #StructuralBioMaterials #OrganicRevolution2030

1. Executive Summary & Key Judgments

Hempoxies™ 13A Classic is the immediate-revenue structural tier of the Omega platform. This document formalizes the total vertical integration of the 11-component matrix, documenting the synthesis of the macro-reinforcement (**HDCF**) and micro-filler (**HDB**).

Key Judgments:

- **Supply Chain Sovereignty:** By synthesizing every component from hemp biomass, Landry Industries eliminates reliance on global carbon fiber and petroleum-resin markets. [1][2][3]
- **Mechanical Alpha:** 13A outperforms 6061 Aluminum in specific strength while remaining carbon-negative. [4][5][15]
- **Investment Security:** The homogeneous mix allows for rapid scaling using existing automotive injection infrastructure.

2. Scope & Intelligence Requirements

Technical master record for 13A production. Requirements: stoichiometry for all precursors and thermal protocols for multi-scale carbonization.

3. Methodology (Collection, Verification, Ethics)

- **Observation:** Dependence on fossil-fuel resins creates economic vulnerability.
- **Hypothesis:** A 100% hemp-derived 11-component stack provides superior chemical cohesion via matched thermal expansion.
- **Verification:** GC-MS for chemical purity; ASTM D638 for mechanical baseline.
- **Ethics:** 100% compliant with the Universal Declaration of Organic Rights (UDOR).

4. Master SOP: The 11-Component Synthesis

A. Matrix Chemistry (The Guts)

1. **EHSO (Matrix):** 100kg Hemp Seed Oil + 20kg Acetic Acid + 30kg H₂O₂ (50%) at 60°C. Refine to EEW: 230-250 g/eq.
2. **QF-MHL (Hardener/Catalyst):** Organosolv extraction of hemp hurd; glycidylation via

bio-epichlorohydrin.

3. **FGE (Diluent):** Reaction of bio-furfuryl alcohol with glycerol-derived epichlorohydrin.
4. **Hemp-Derived Amine:** Reductive amination of lignin-derived aldehydes over Raney nickel.
5. **Hemp Silane (Coupling):** Hydrosilylation of triethoxysilane with Limonene/Myrcene terpenes.

B. Reinforcement & Utility

1. **Mitlinite (HDCNS - Nano):** 800°C Carbonization of bast fiber + KOH activation for 2D nanosheets.
2. **HDB (Biochar - Micro):** Pyrolyze hemp hurd at 500°C in oxygen-limited kiln; ball-mill to <20µm.
3. **HDCF (Carbon Fiber - Macro):** Oxidative stabilization of bast at 250°C, followed by 1200°C Carbonization in N₂.
4. **Circular Filler:** Encapsulated waste PET/PP ground to 50µm.
5. **Limonene:** Bio-solvent for repair and viscosity control.
6. **Diels-Alder Adducts:** Thermo-reversible modules for 100% recyclability.
